**2381 Denver November 19-25, 1871**

*Henry J. Fenton, Observer*

In the 1880s the Colorado legislature approved and funded the “*Colorado Meteorological Association*” to better monitor and document the climatic resources of our young state.

## BULLETIN

OF THE

### Colorado Meteorological Association.

3.

JUNE, 1886.

Weather records extending through the month of June have been received from nineteen stations, the positions of which will be found upon the hectographed sketch accompanying the bulletin for May. They include all stations whence statistics for that bulletin were derived, with the exception of the ranch near Sanborn, where observations had to be suspended on June 16th. The new stations with their altitudes and the names of observers are as follows:

Hugo .....	5068	I. B. Perkins, M. D.
Idaho Springs .....	7500	Ignatius Zeller.
Pandora .....	8700	C. Laforge.

#### THE WEATHER OF JUNE, 1886.

The weather of the month may be described under three periods, the first extending from June 1st to 9th, the second including the week from the 10th to the 16th inclusive, and the third comprising the remainder of the month. During the first period, there was first a barometric rise lasting from two to four days at different stations, then a decline of no great magnitude, and finally a rise to a second maximum which terminated the period. The weather was in general cool, and showers were frequent. The first and second days were dates of the most important rainfall of the month, which appears to have been confined to the eastern slope of the continental divide.

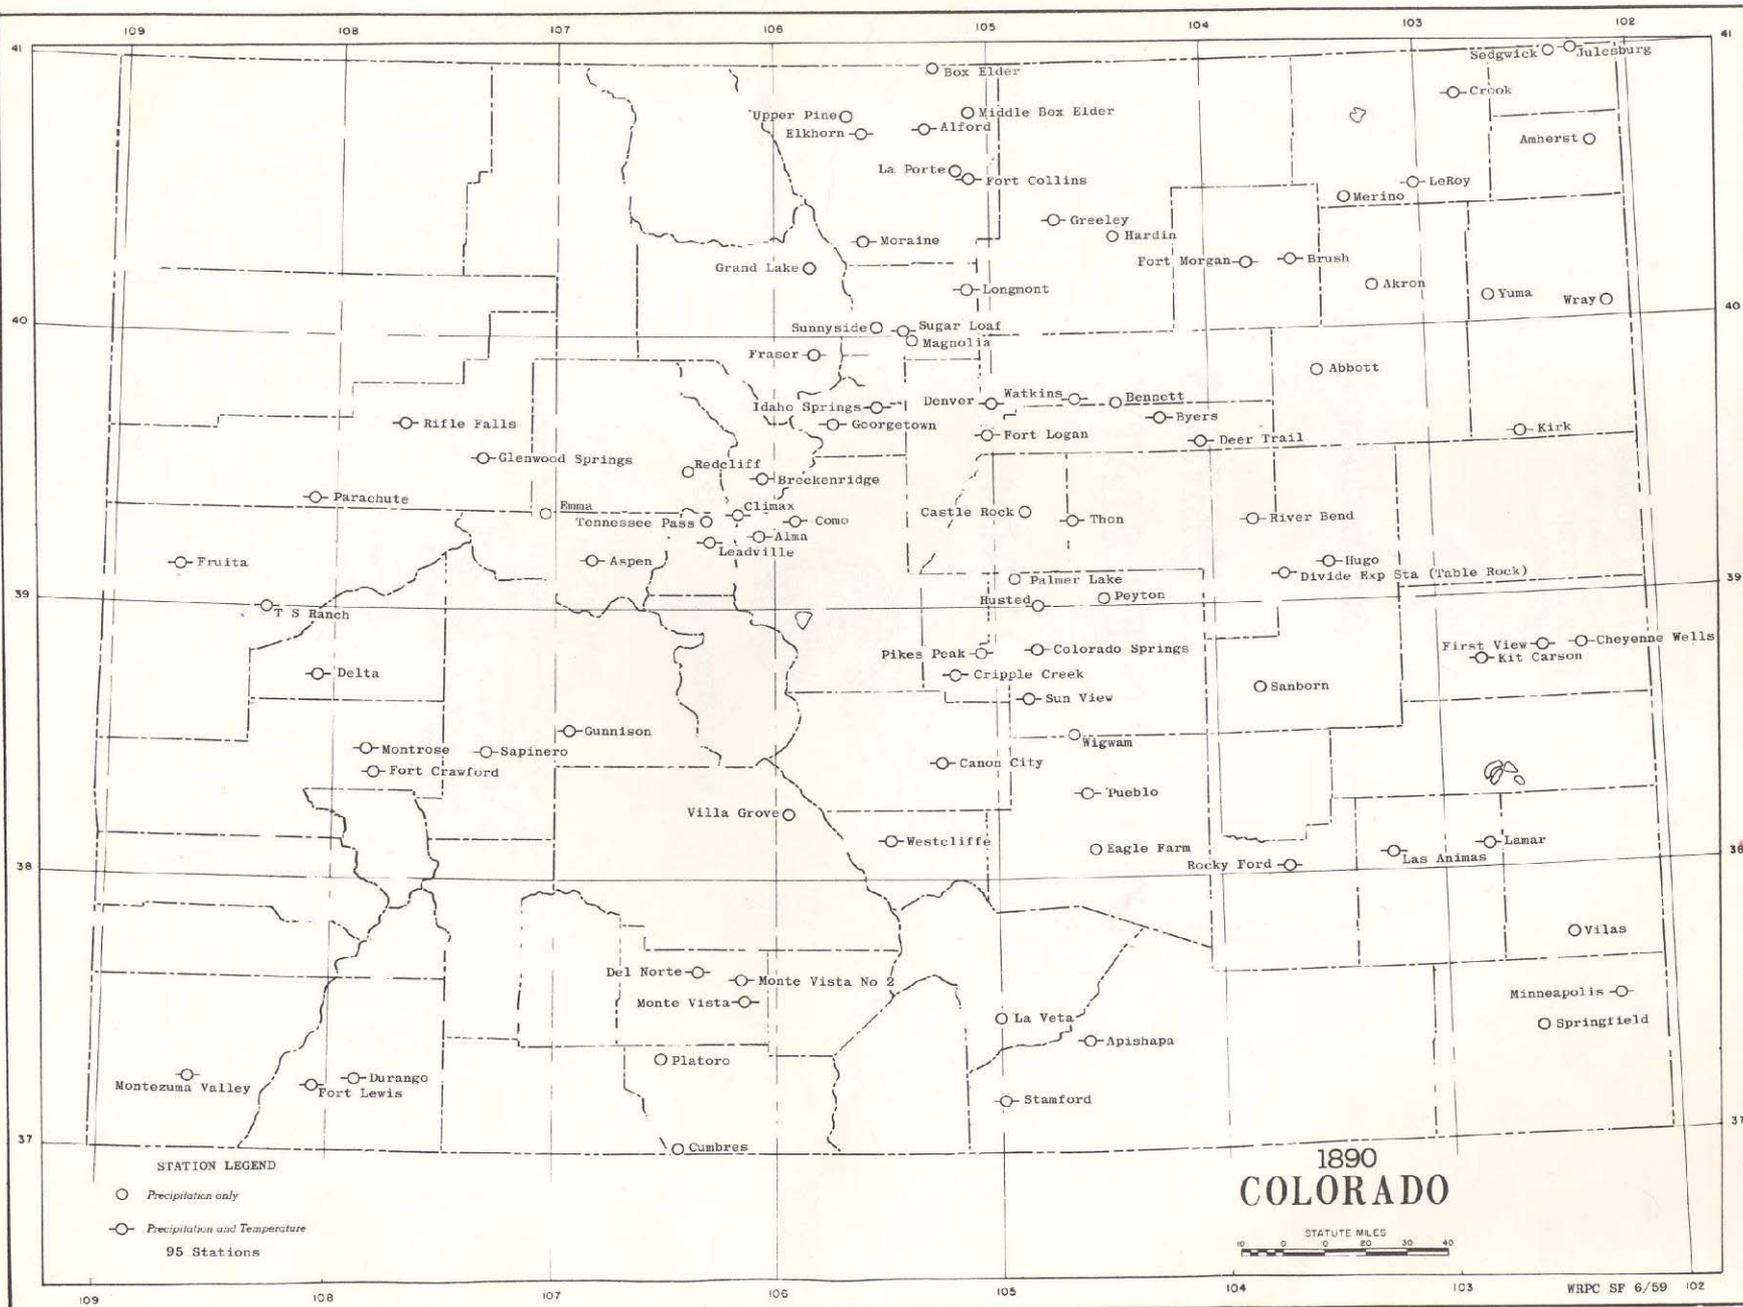

During the second period the barometer descended to the monthly minimum on the 12th, and rose during the four days following. There was no rainfall reported from the western slope, and only local and moderate showers on the eastern side. The 13th and adjacent days were remarkably clear. The temperature of the week was high, declining near the close.

The weather of the third period was quite local in character. The oscillations of the barometer were slight, the lowest daily mean, on the 24th, being generally higher by more than two tenths of an inch than that of the 12th. The precipitation was all or almost all in the form of thunder-showers of small area. Some of these, in the north and northeast of the state were accompanied by violent hail, doing damage to crops which was then estimated to reach a quarter of a million dollars. The temperature was moderate at the beginning of the period, but exhibited a decided increase toward the end of the month.

In 1890 the USDA took over the responsibilities of climate monitoring on a national level, and the first civilian weather service was formed – the U.S. Weather Bureau

# Colorado Weather Stations in 1890

Since then, the U.S. Weather Bureau/National Weather Service has faithfully maintained an oft taken for granted network of weather stations in Colorado and across the country – the Cooperative Observer Network

# National Weather Service Cooperative Network

From Kelly Redmond, WRCC

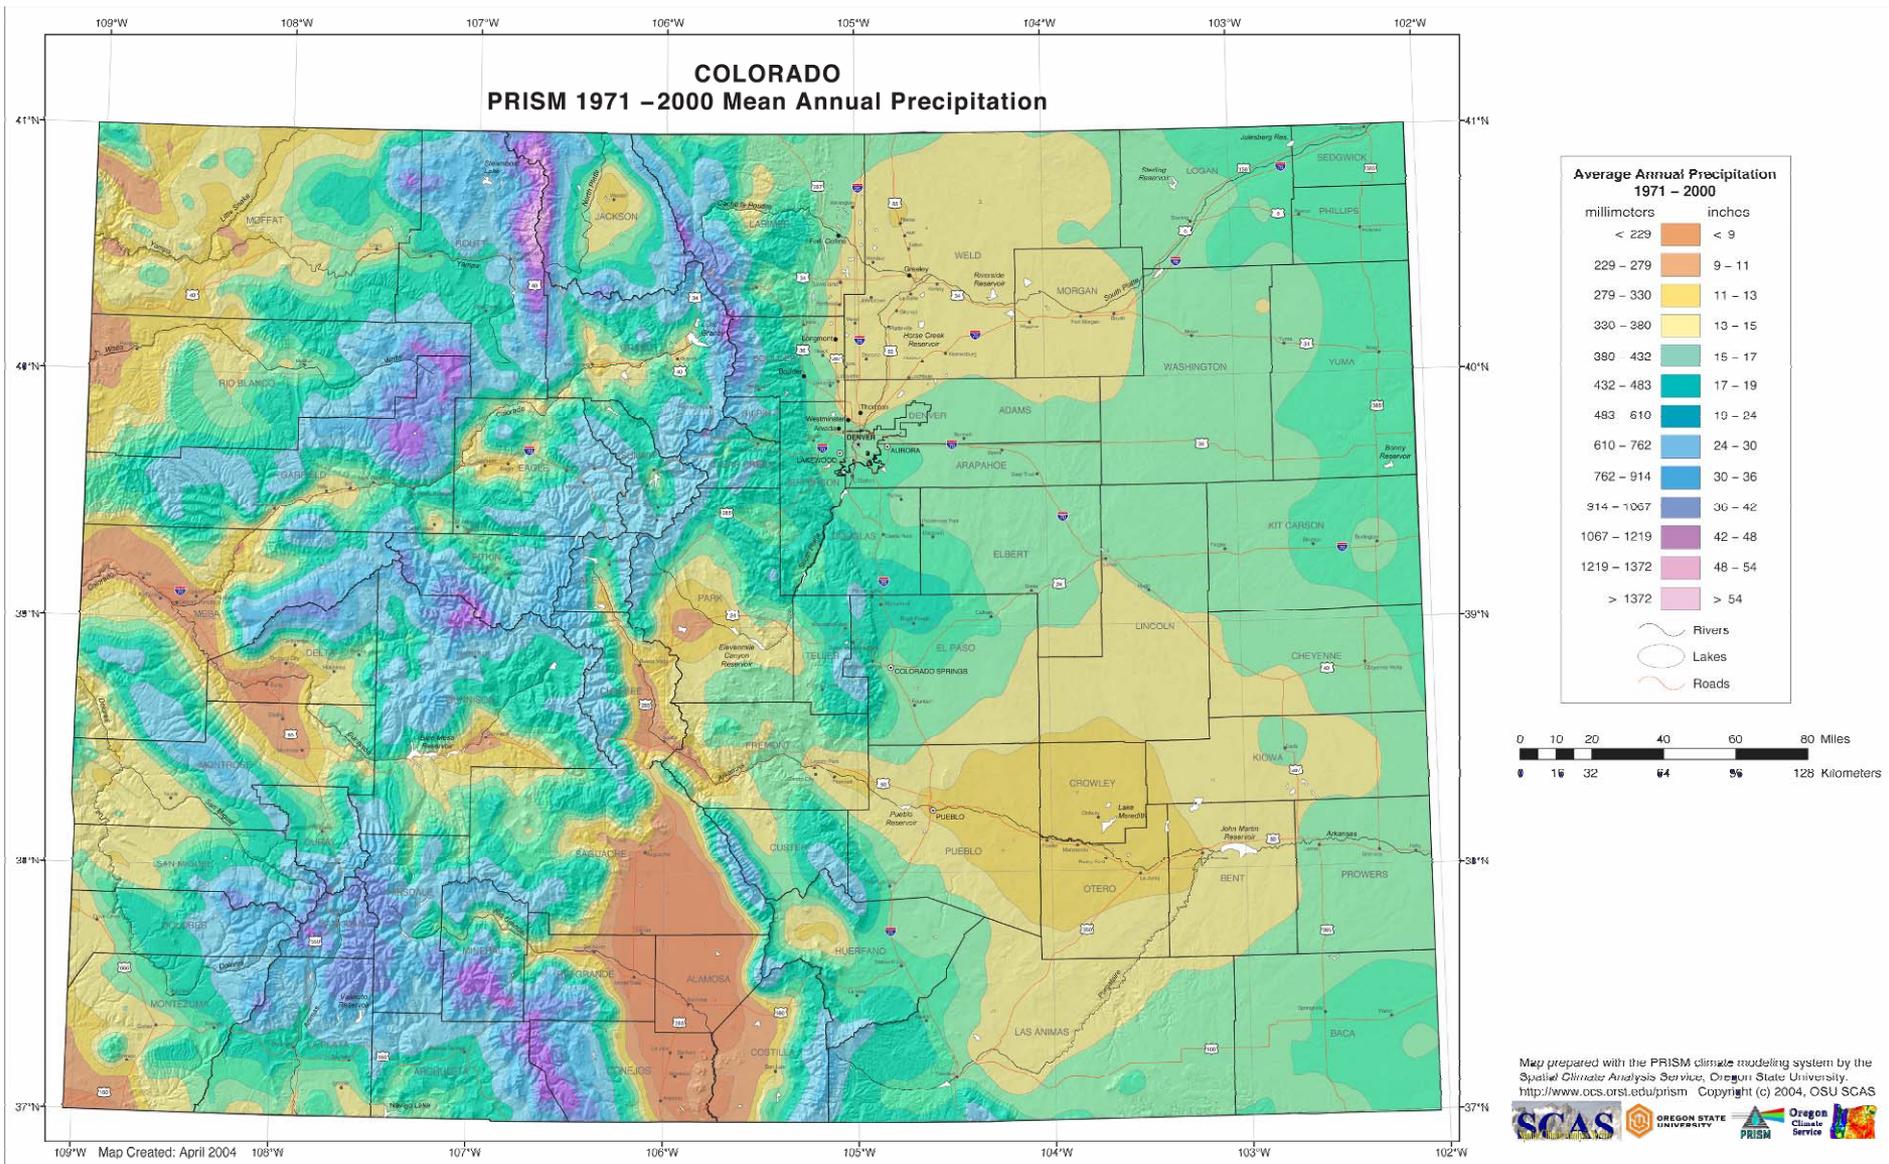

**Approximately 5000 daily max/min temperature stations, 8000 daily precipitation stations, 3000 automated hourly precipitation stations.**

In recent years, many other organizations have gotten involved in weather measurements

The NWS stations remain the backbone network for long-term climate monitoring

# Colorado average annual precipitation map

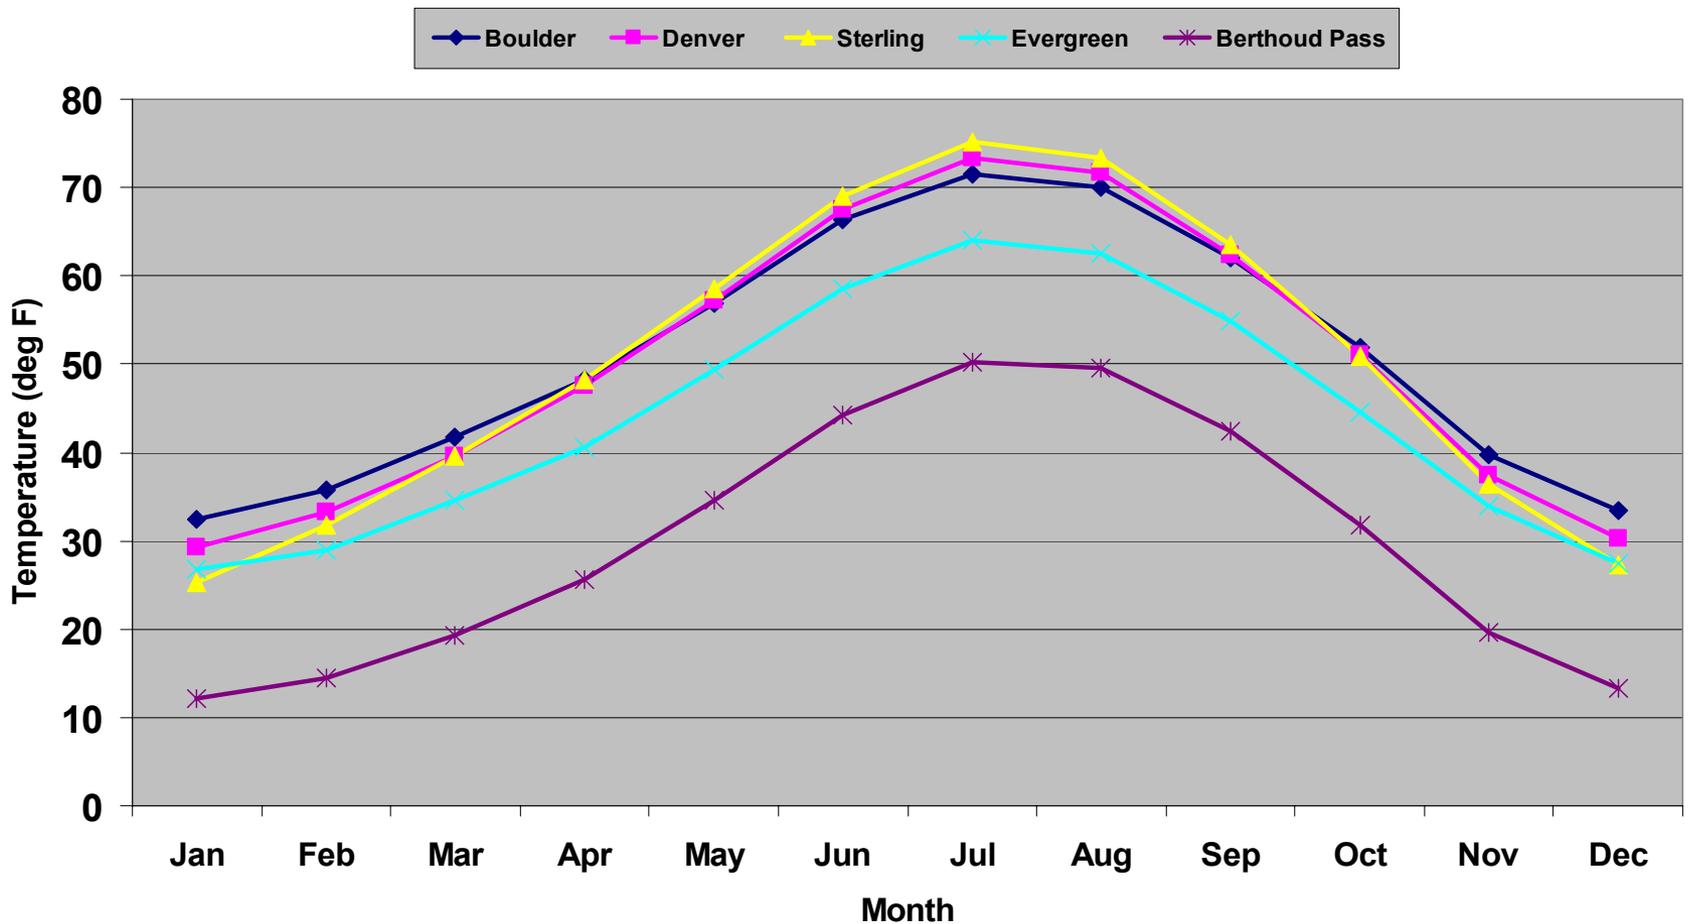

What have we learned from  
nearly 120 years of continuous  
climate monitoring in the  
South Platte Basin?

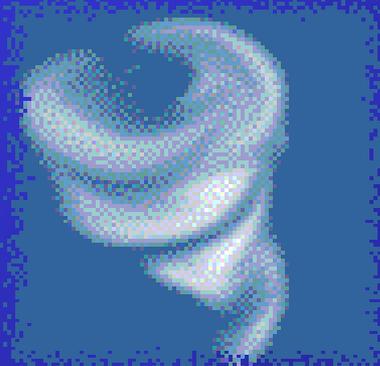

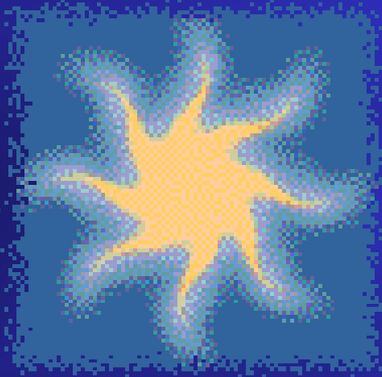

# Winters are consistently colder than summers — ☺

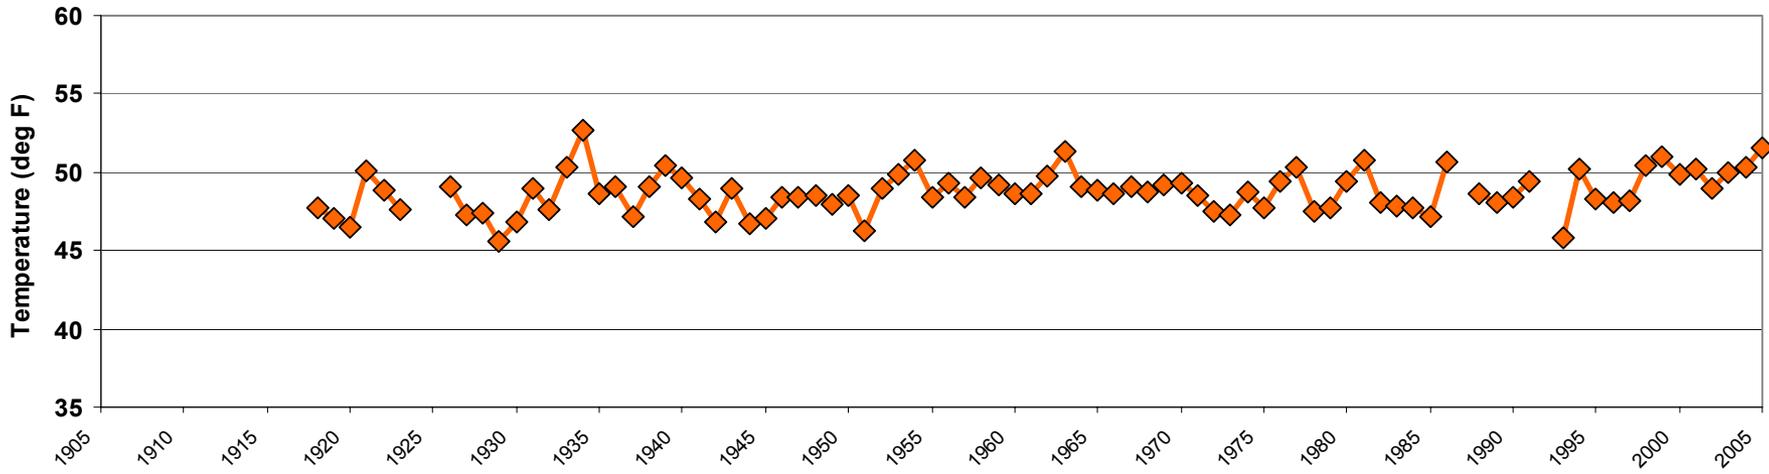

Average Monthly Temperatures (1971-2000) for Selected Stations  
in the South Platte

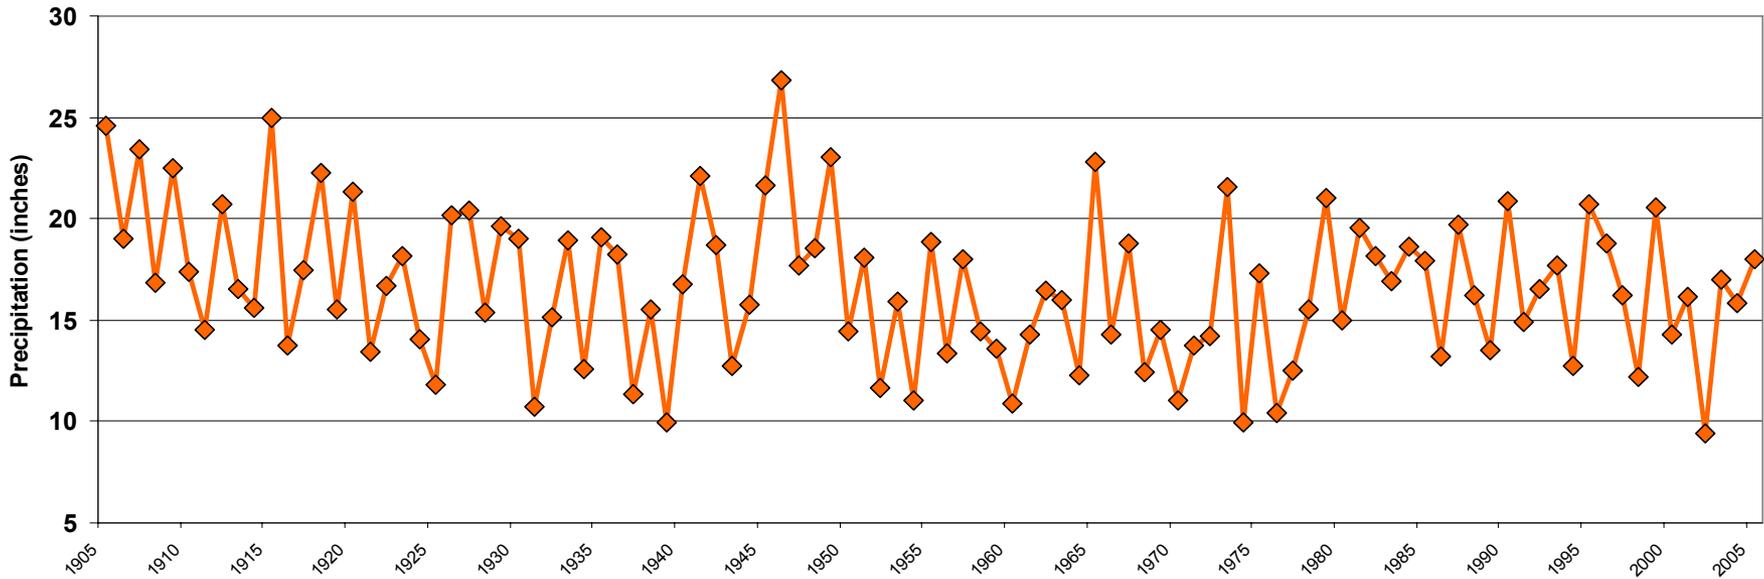

Temperatures are far more stable than precipitation. In fact most other climatic elements (humidity, wind, sunshine and cloudiness, evaporation, etc.) are much more consistent from one year to the next than precipitation.

### Akron 4E Average Mean Temperatures

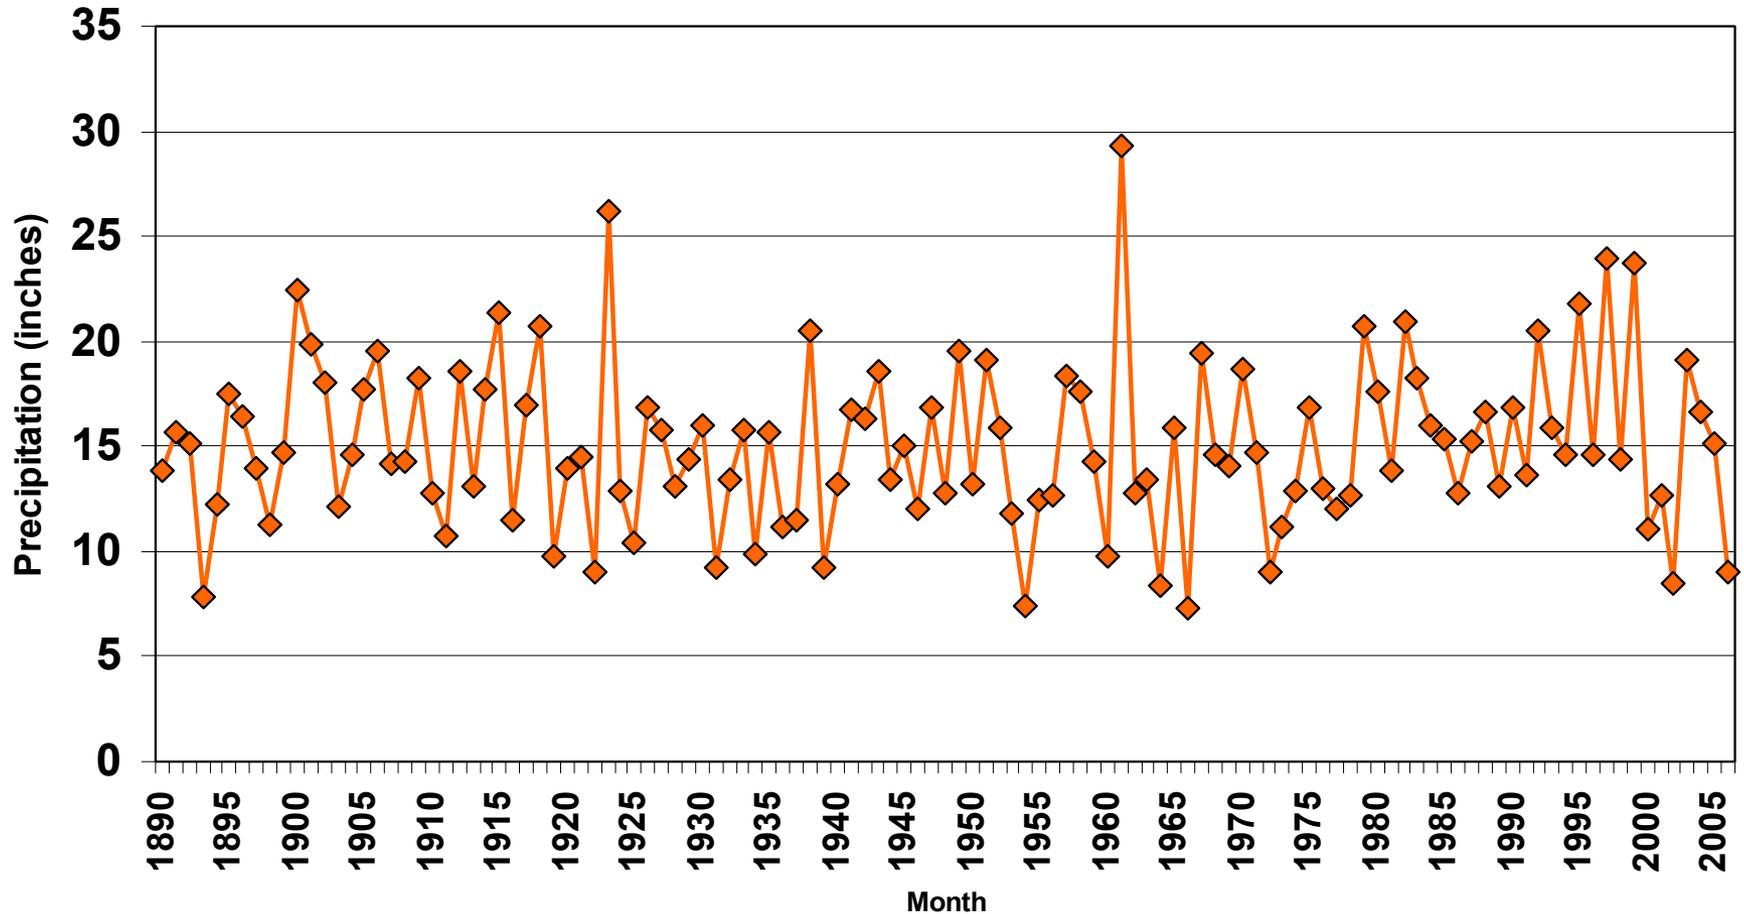

### Akron 4E Annual Precipitation Totals

# Precipitation varies by as much as 400% from a very dry year to a very wet year

**Fort Collins Total Water Year Precipitation  
(1890 through 2006)**

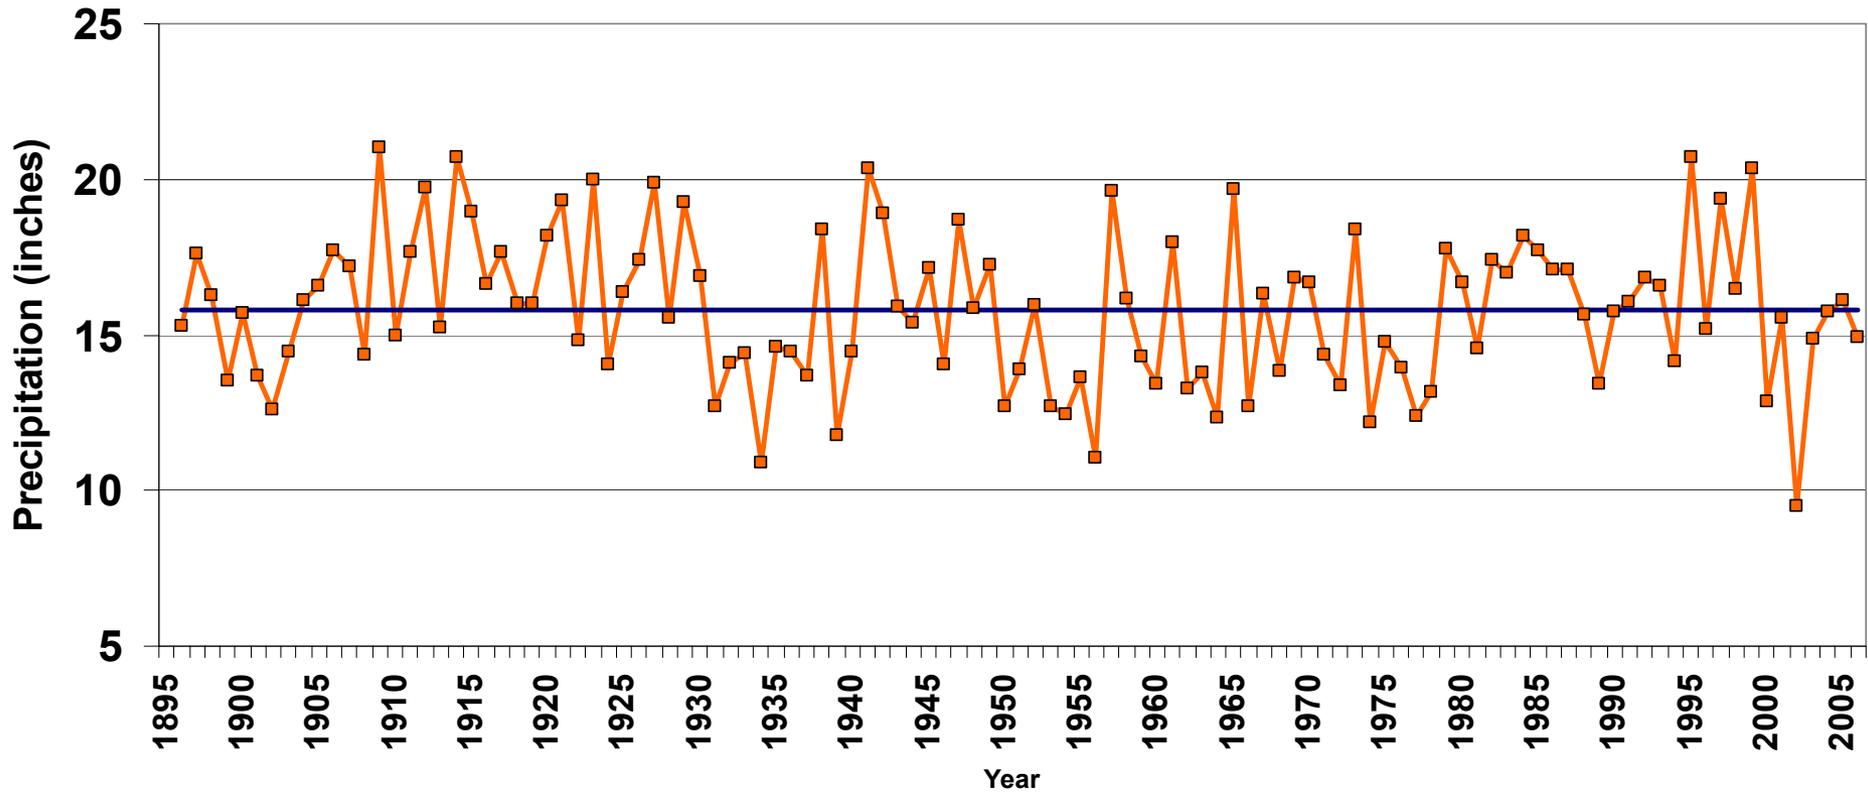

# Drought Visits Our Area Regularly

Photo by NRCS

# Colorado Statewide Water Year Precipitation

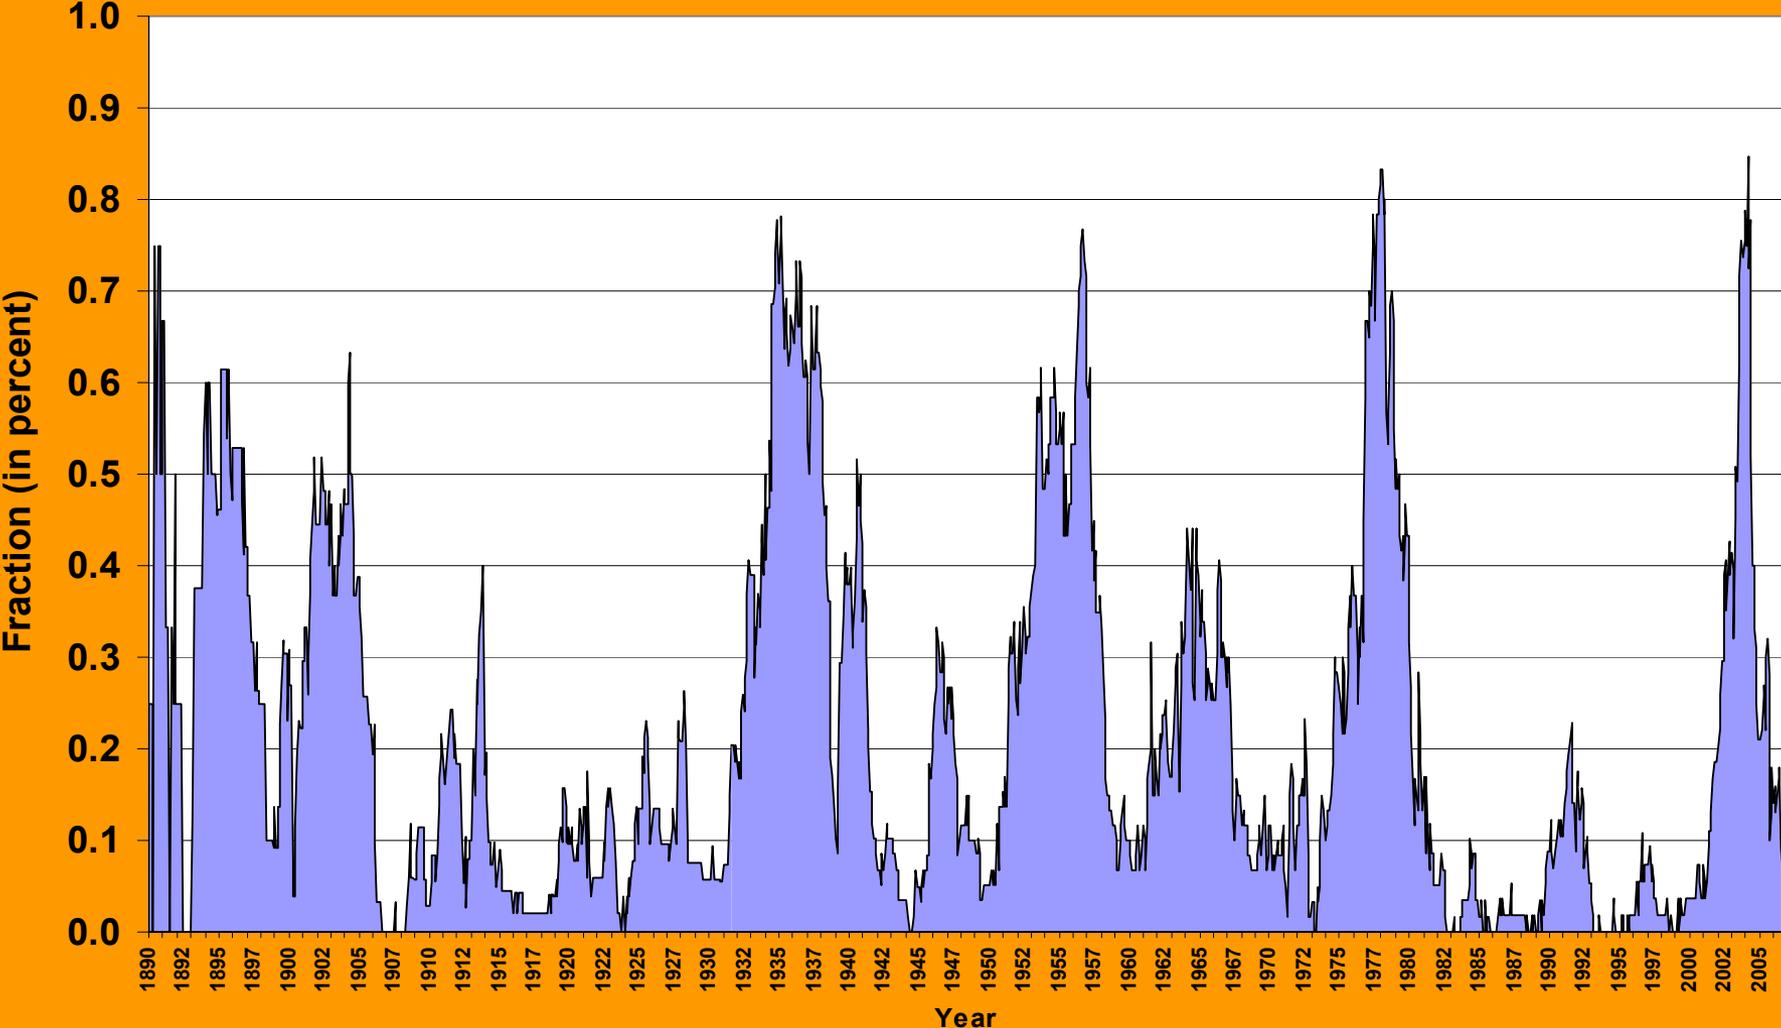

Colorado Statewide Water Year (Oct-Sep) Precipitation  
from 1896 - 2006

# Fraction of Colorado in Drought

## Based on 48 month SPI

(1890 - Sep 2006)

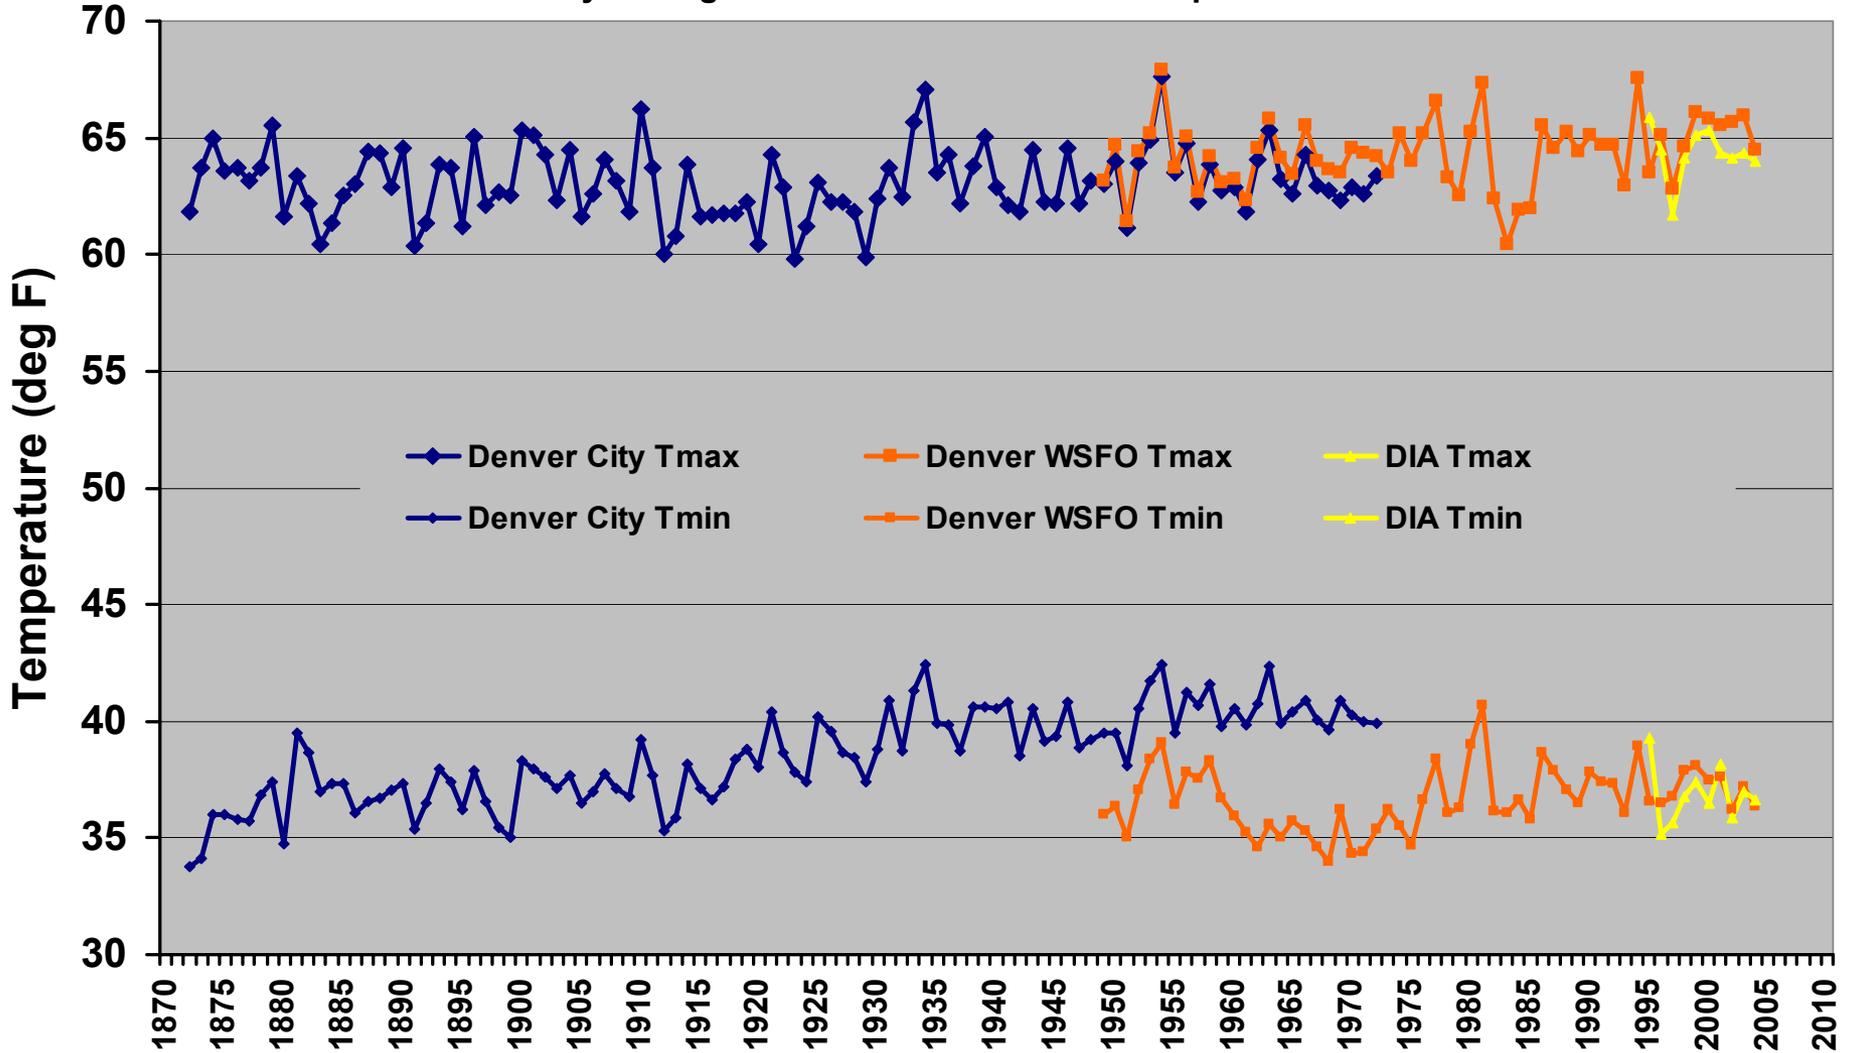

Confidently detecting  
climatic trends is much  
more challenging and  
difficult than  
determining spatial  
patterns, seasonal cycles,  
or year-to-year  
variations

# Denver (all 3 stations)

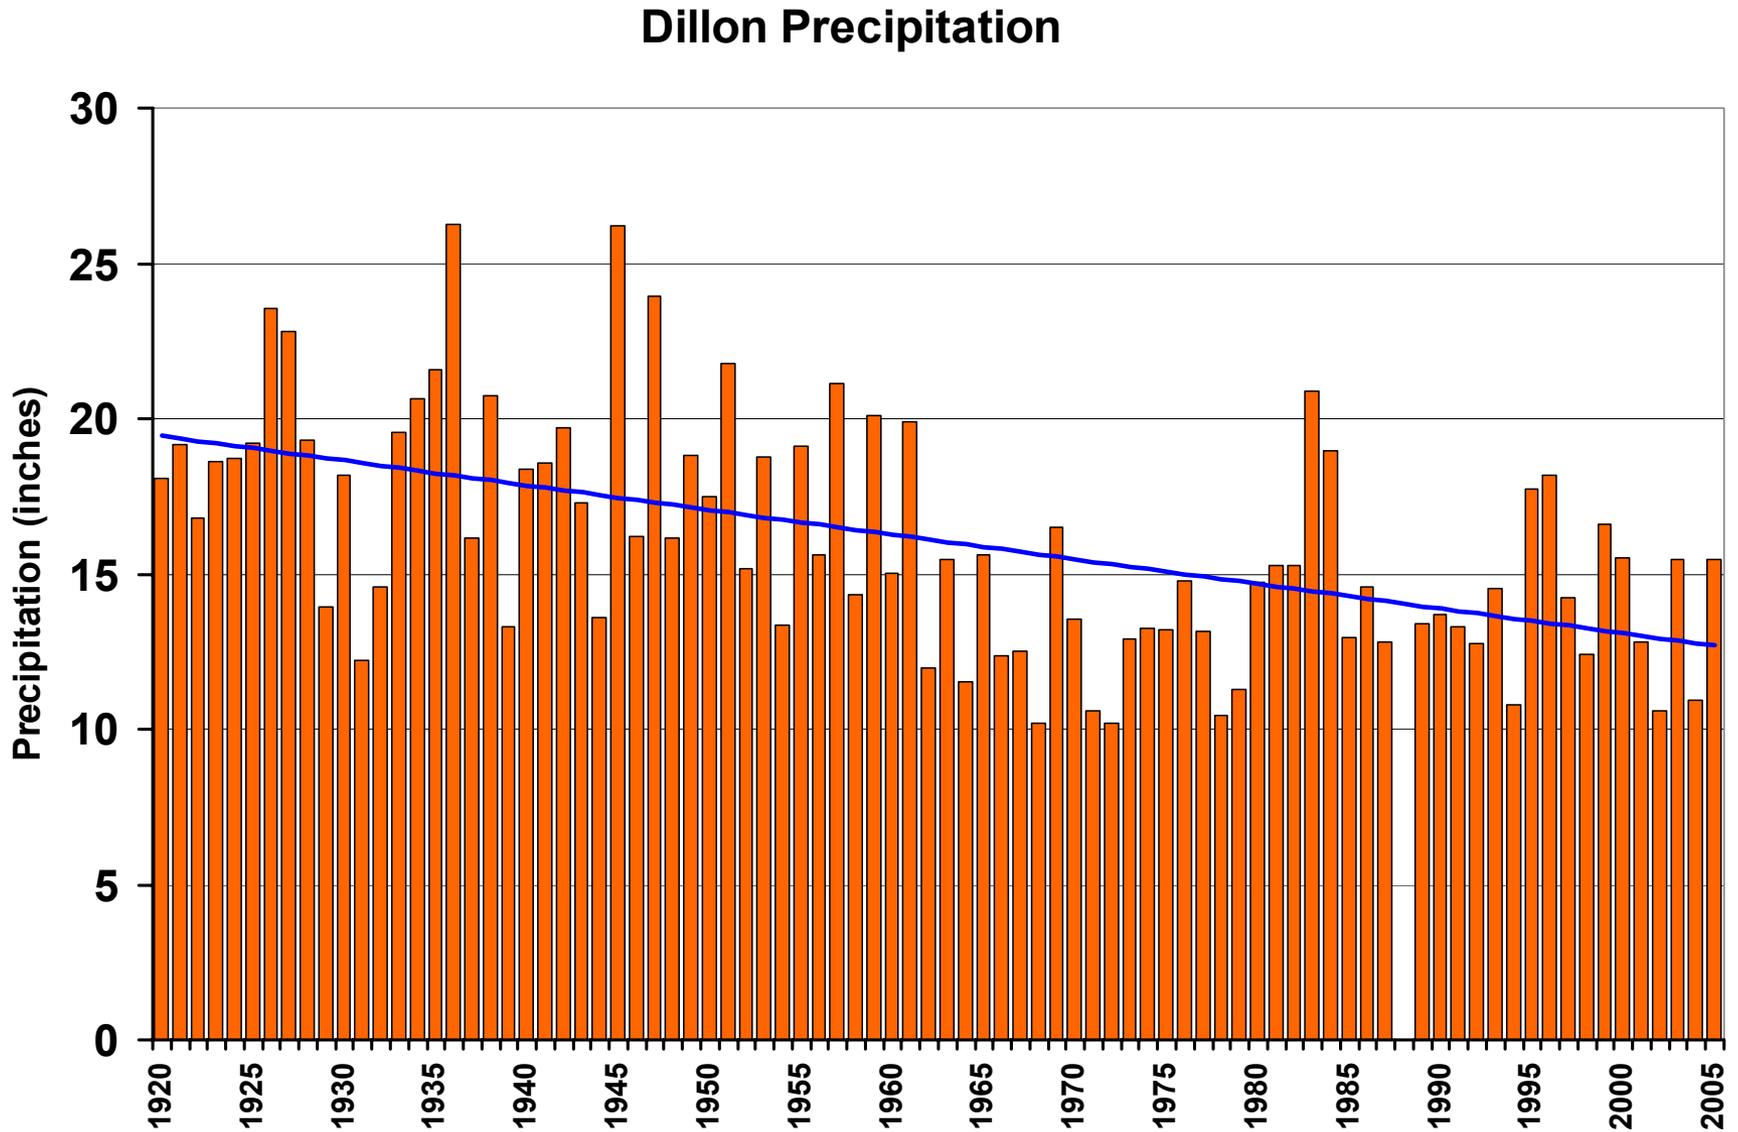

Monthly Average Maximum and Minimum Temperatures

We can find many frustrating limitations to our climate records –

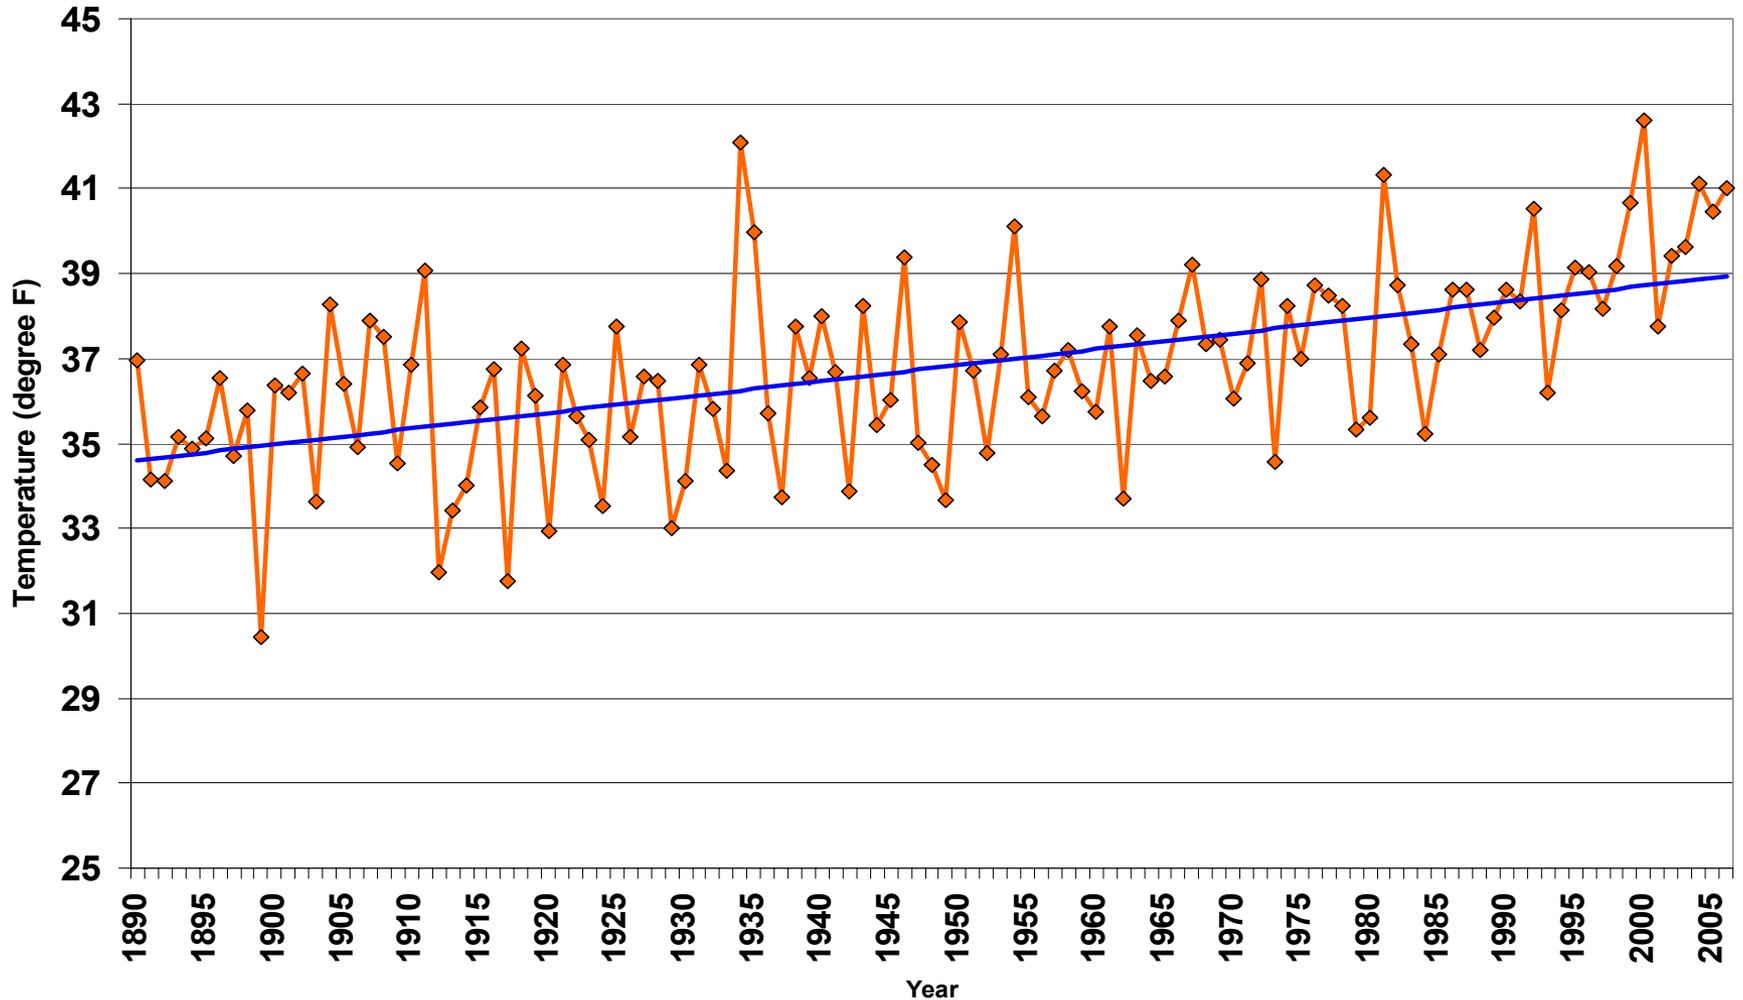

- Changing instrumentation,
- Aging weather observers,
- Changing environments around our weather stations,
- Changing weather station locations,
- Automation, etc.

# Dillon Annual Precipitation

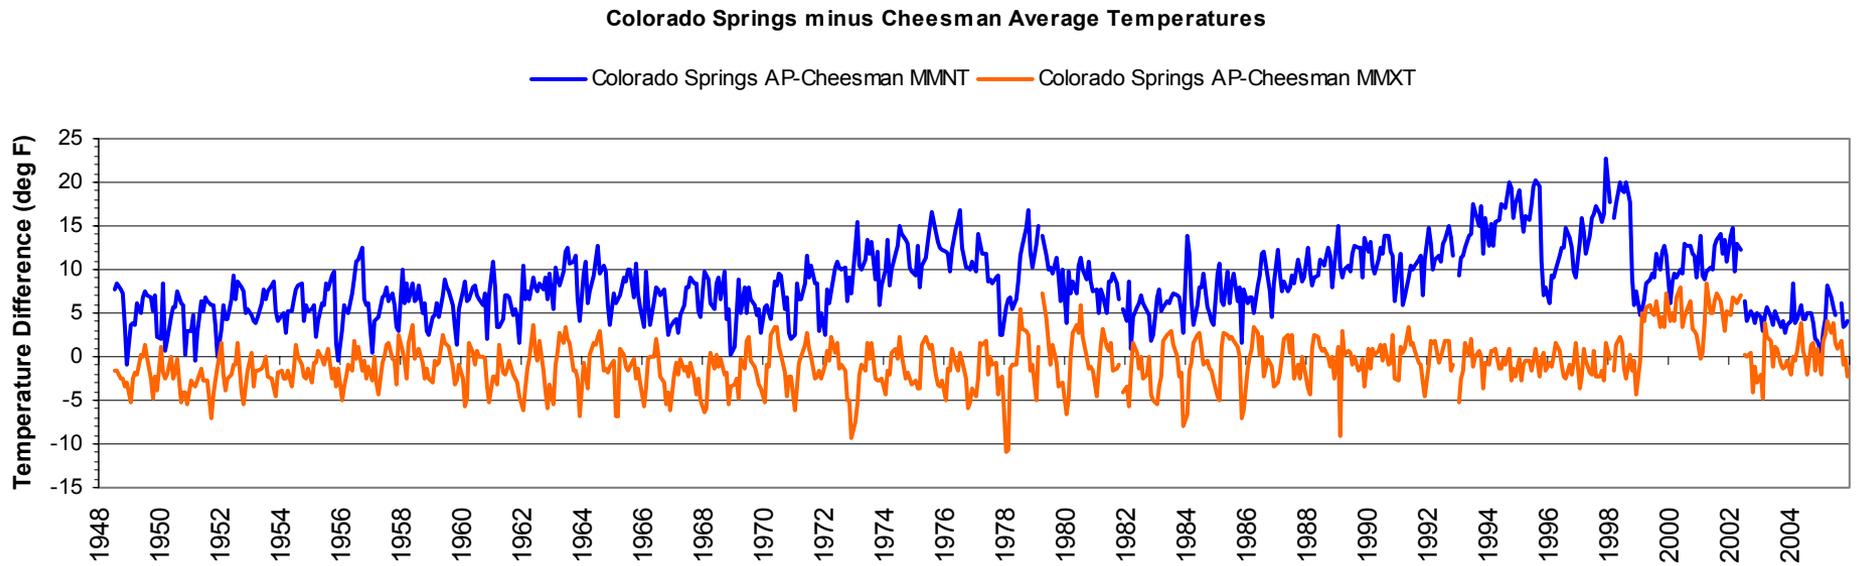

# Fort Collins Winter Temperatures

Fort Collins Water Year Average Temperatures  
for Winter (Oct-Apr)

# Colorado Springs minus Cheesman Temperature Difference

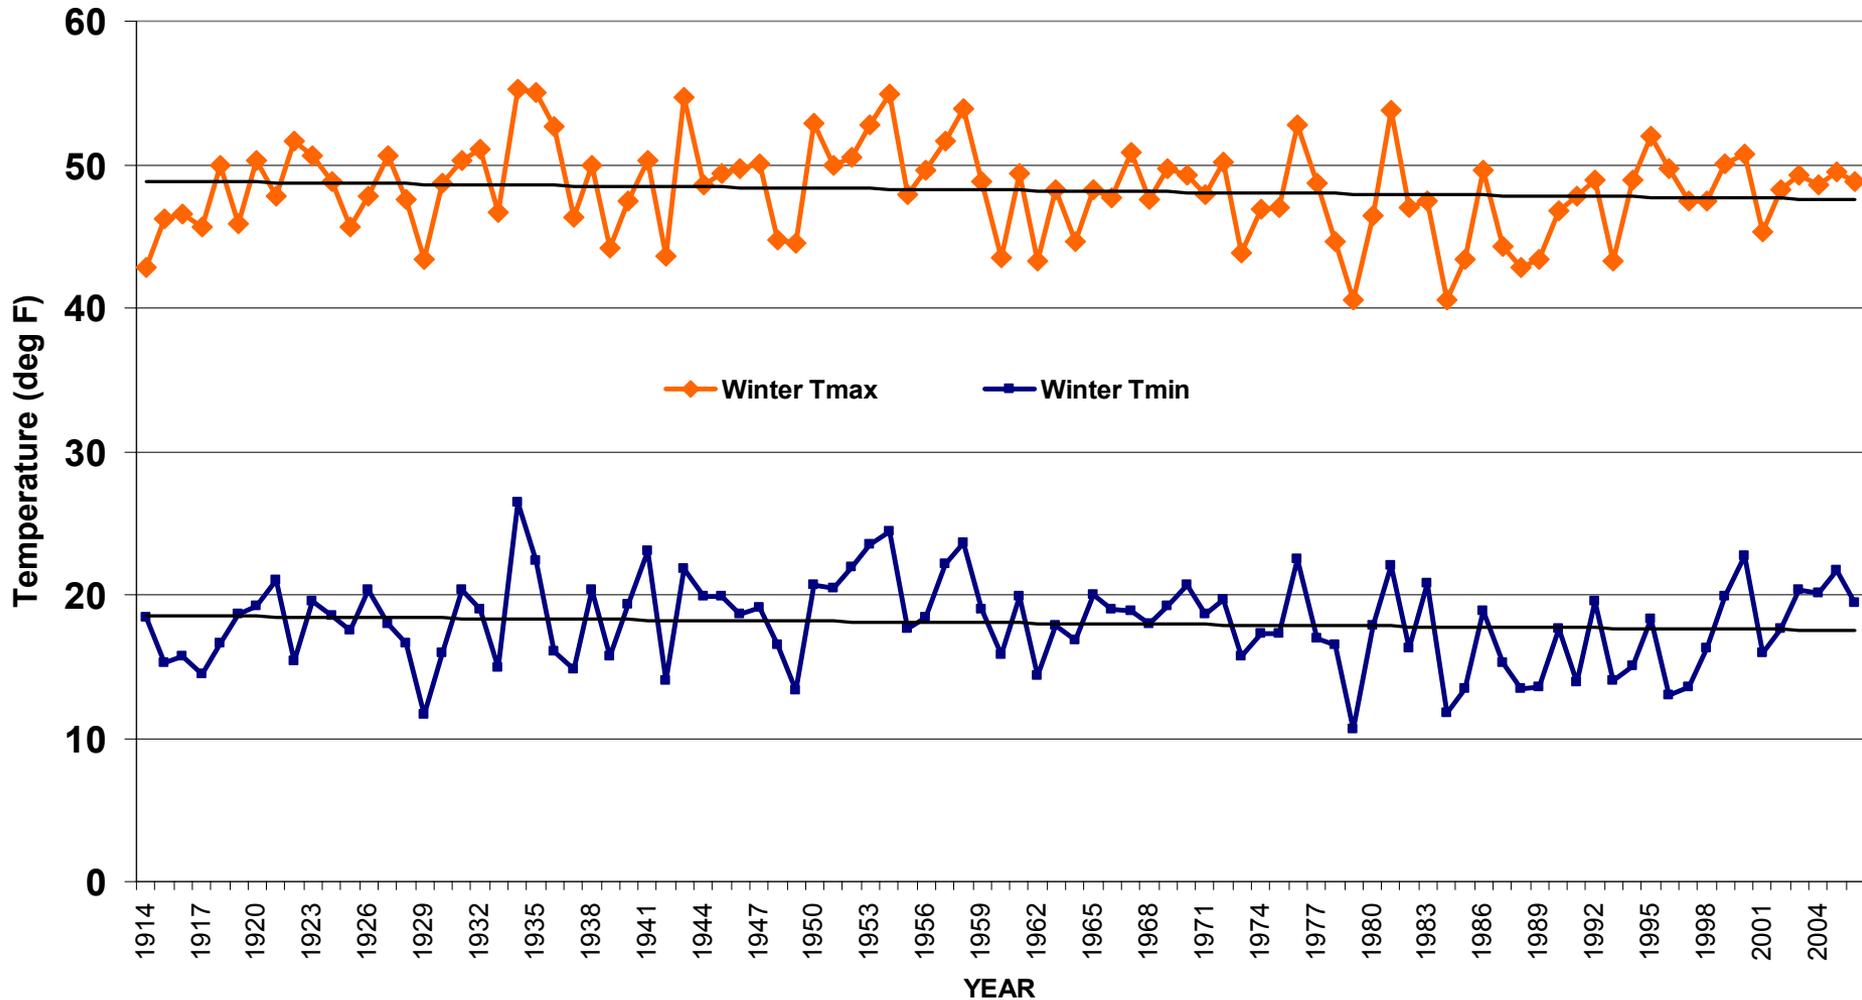

Still, our climate records are more complete, consistent, and widespread than nearly all other forms of long-term environmental monitoring (i.e. we shouldn't whine).

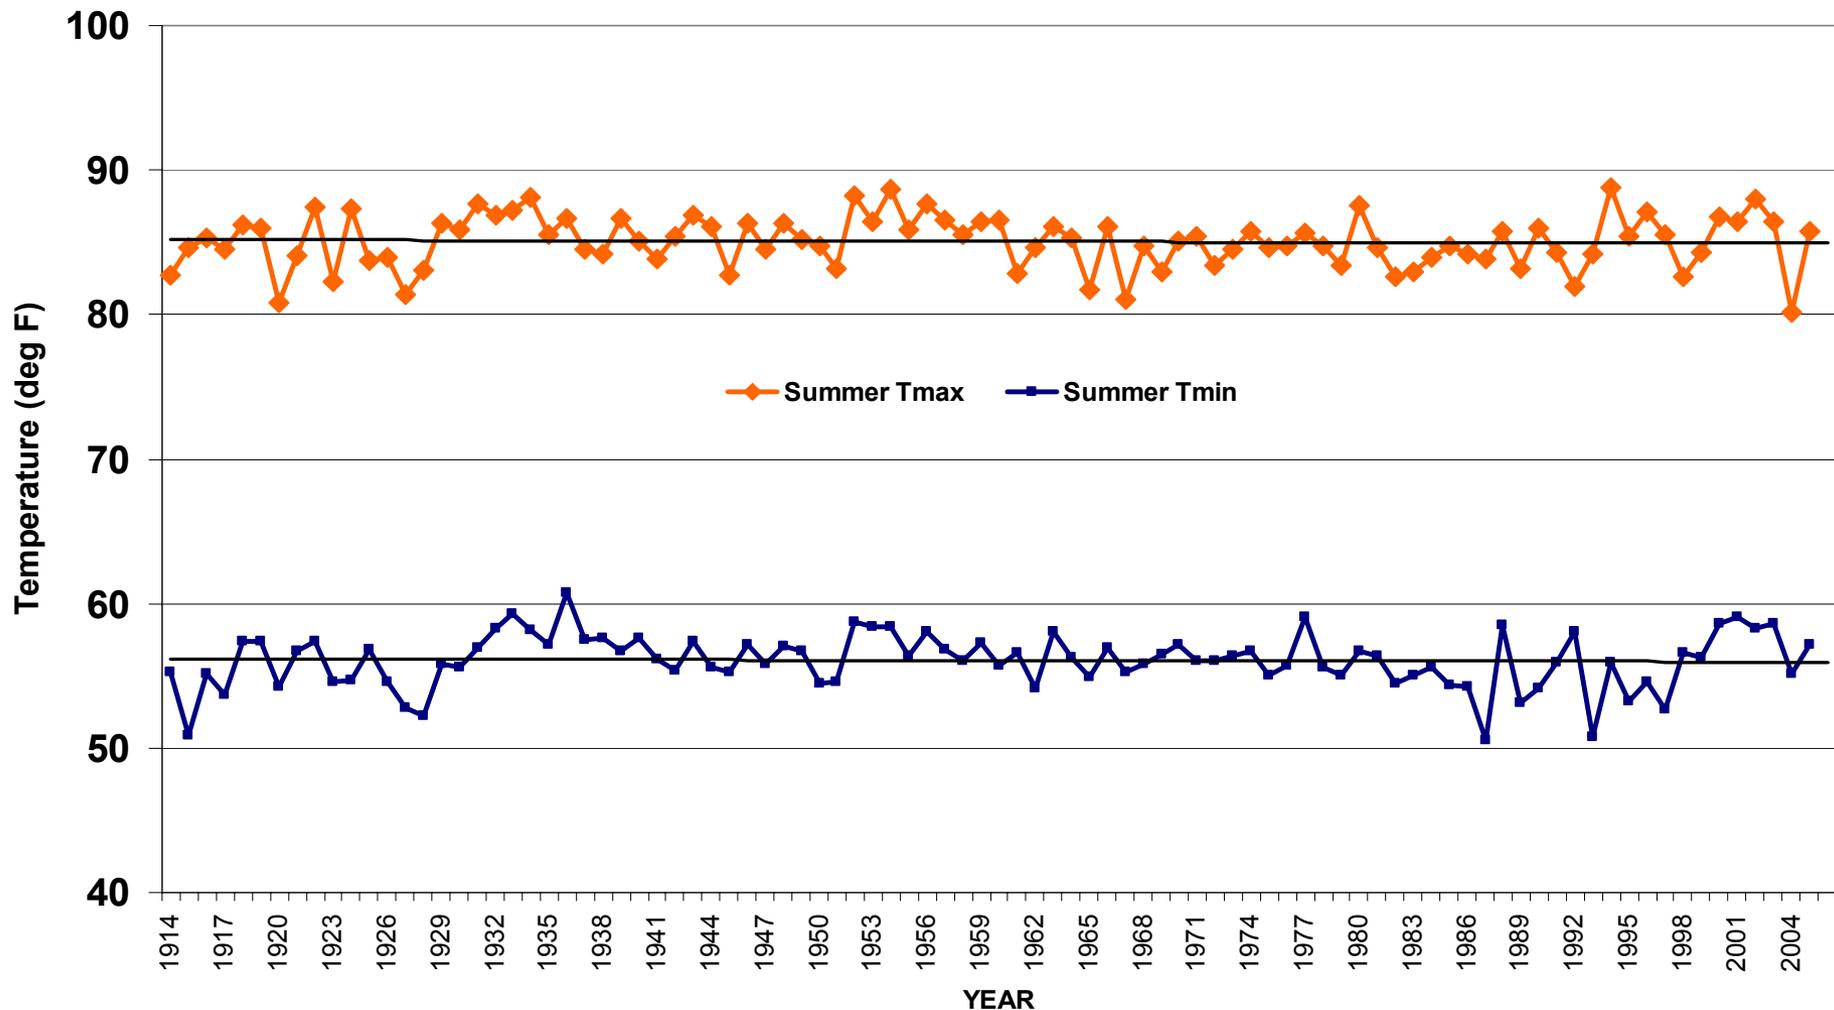

# Kassler Winter Temperatures

**Kassler Winter (DJF)**  
Average Maximum and Minimum Temperatures

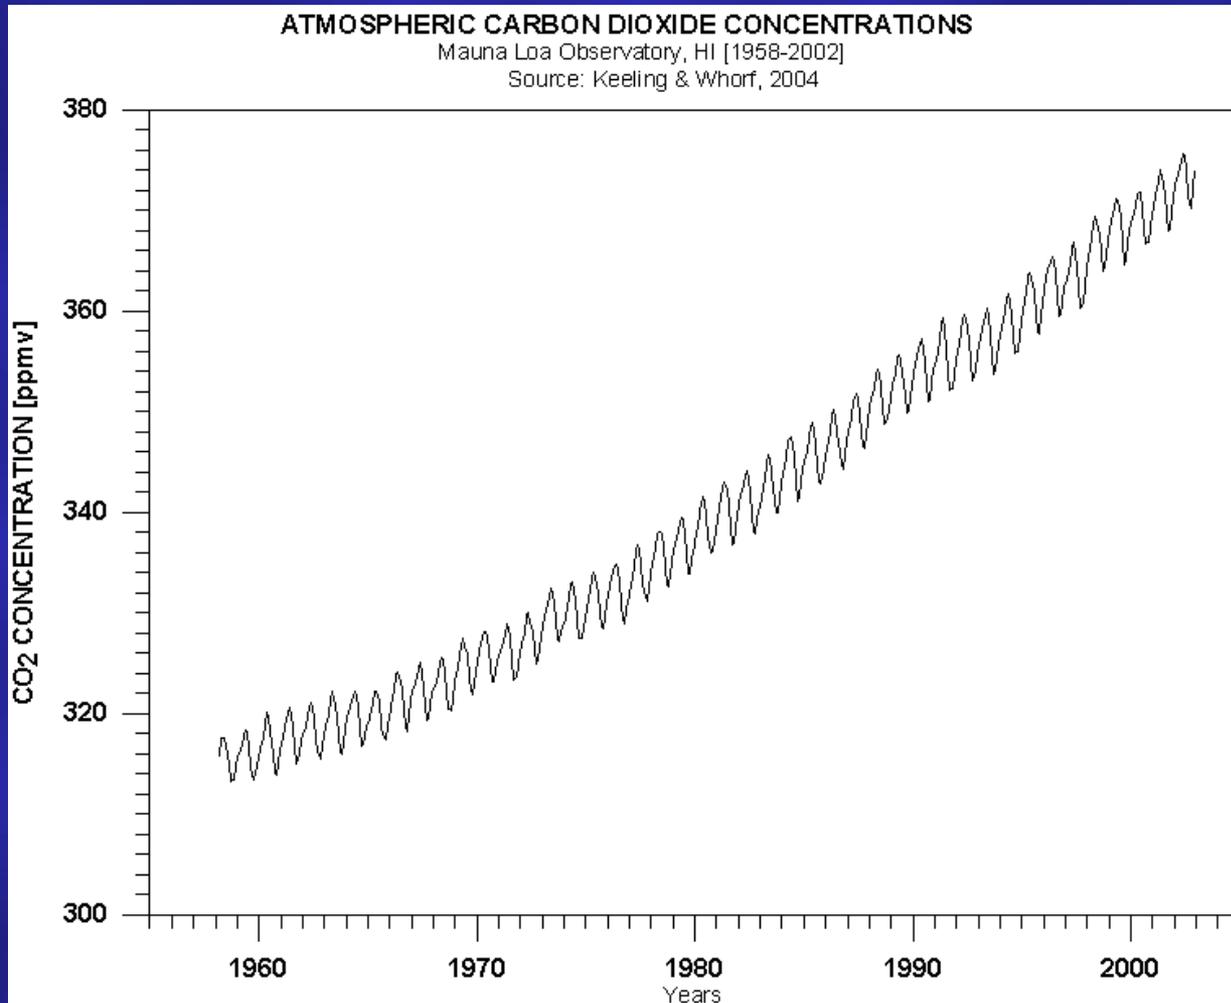

# Kassler Summer Temperatures

**Kassler Summer (JJA)**  
Average Maximum and Minimum Temperatures

If climate is changing (man caused or otherwise),  
it will still be a long time before we can tell if  
our precipitation patterns are changing.

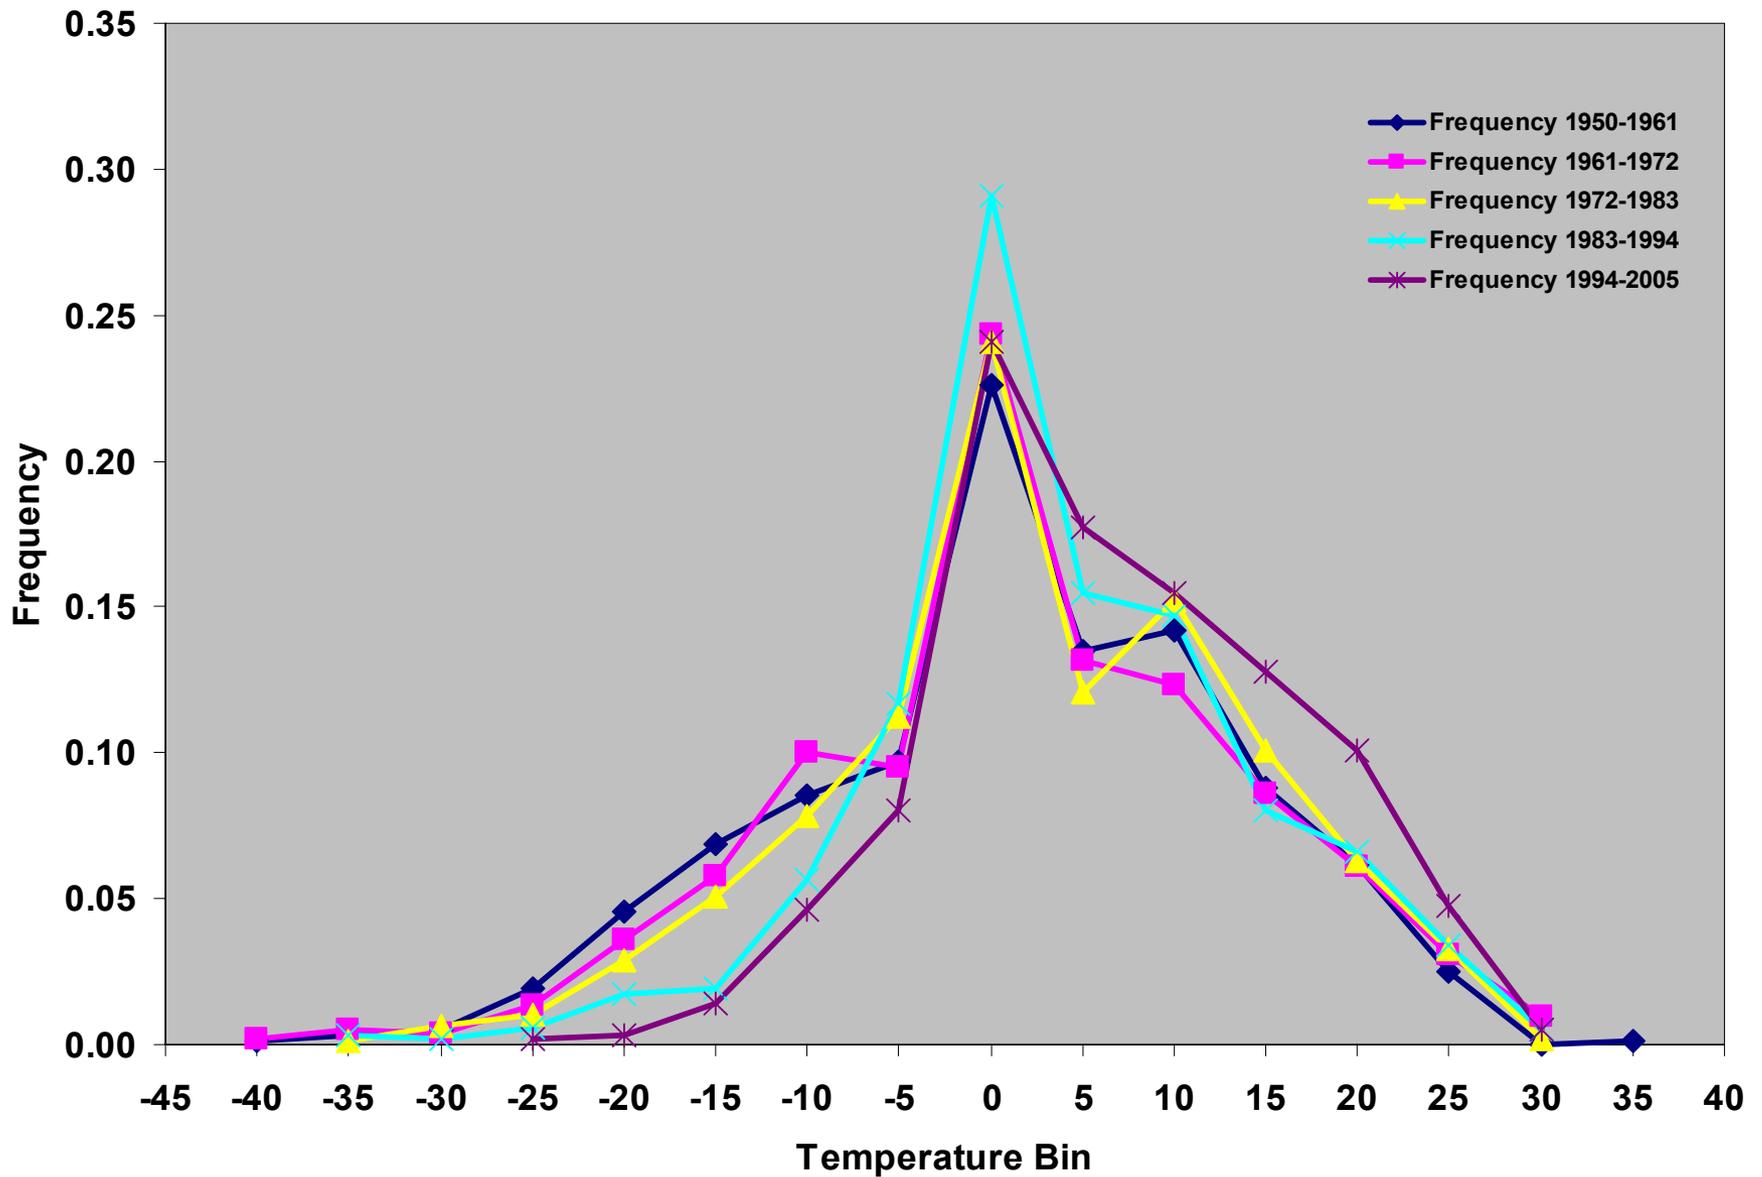

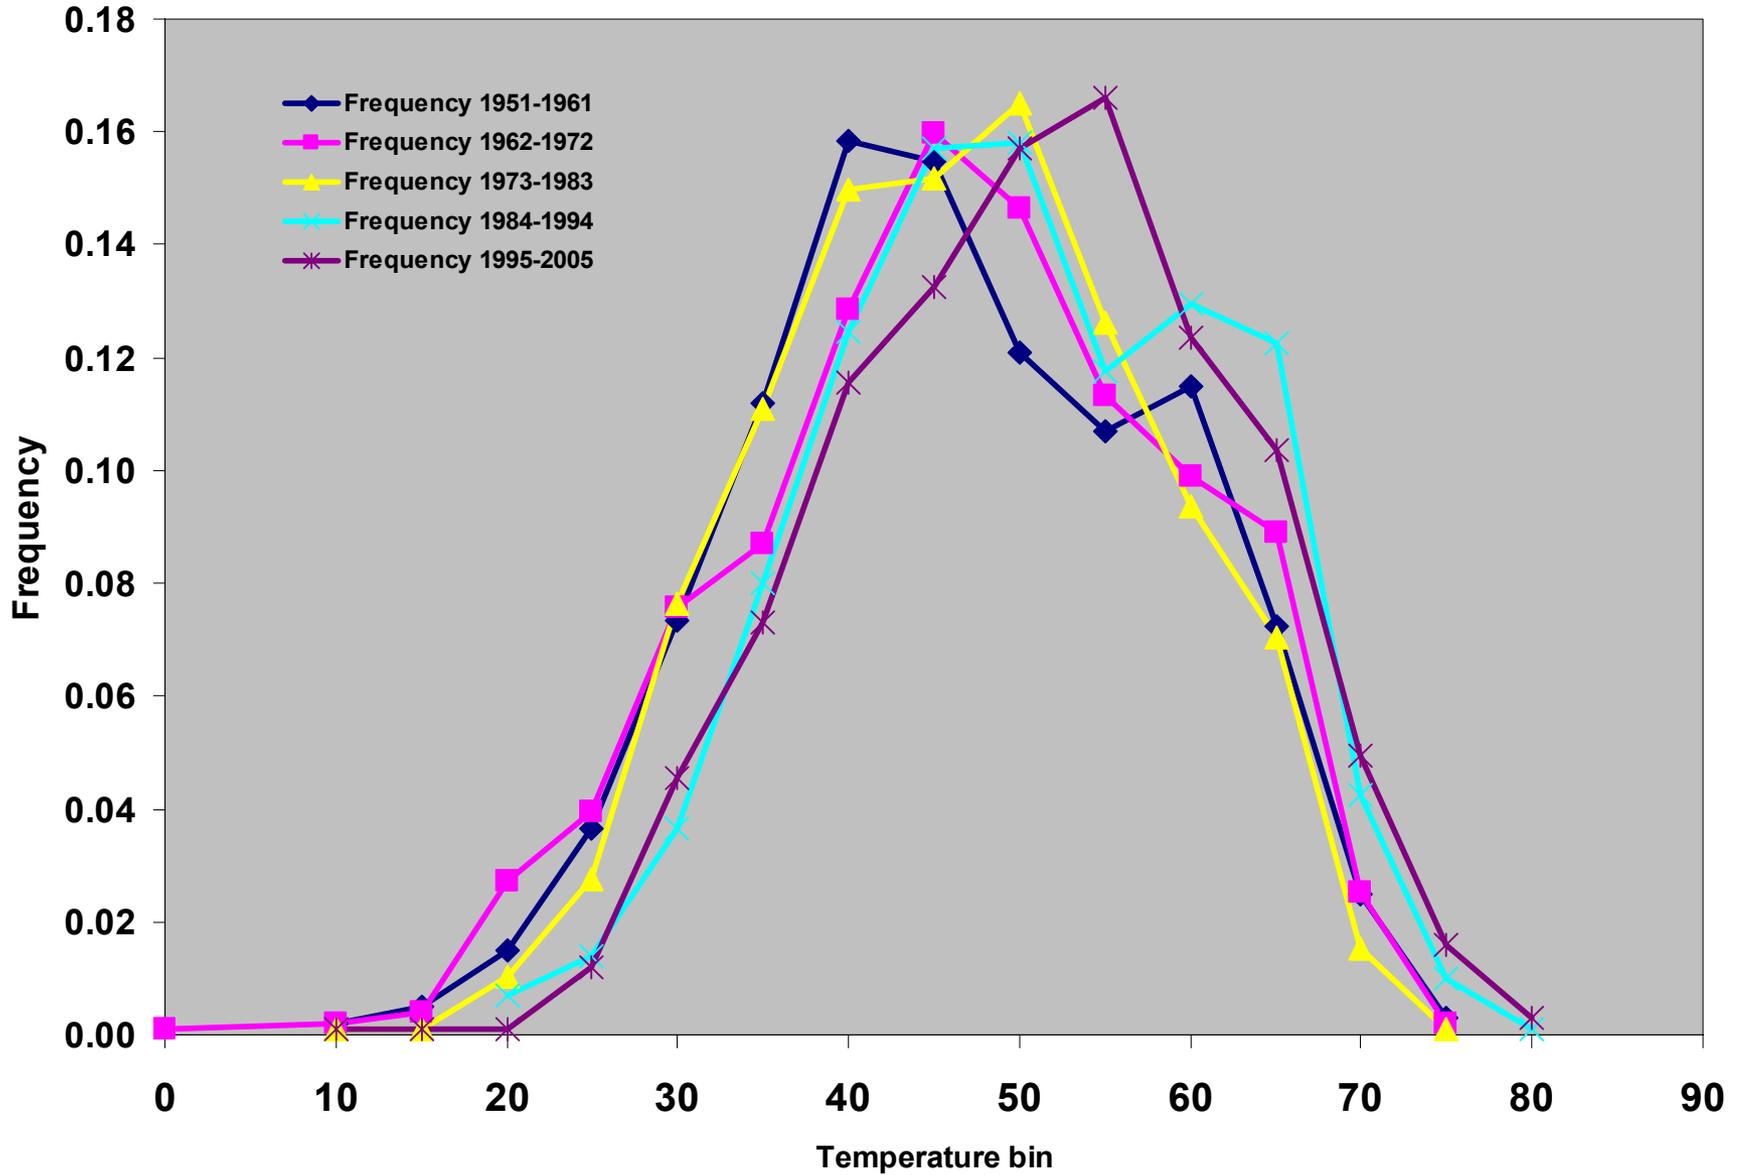

Recently, upward trends in seasonal temperatures have become noticeable in parts of Colorado

That may be significant for water users/planners whether or not precipitation is changing

# Grand Lake, CO Winter Daily Minimum Temperature Distribution (5 degree bins)

# Grand Lake, CO Spring Daily Maximum Temperature Distribution (5 degree bins)

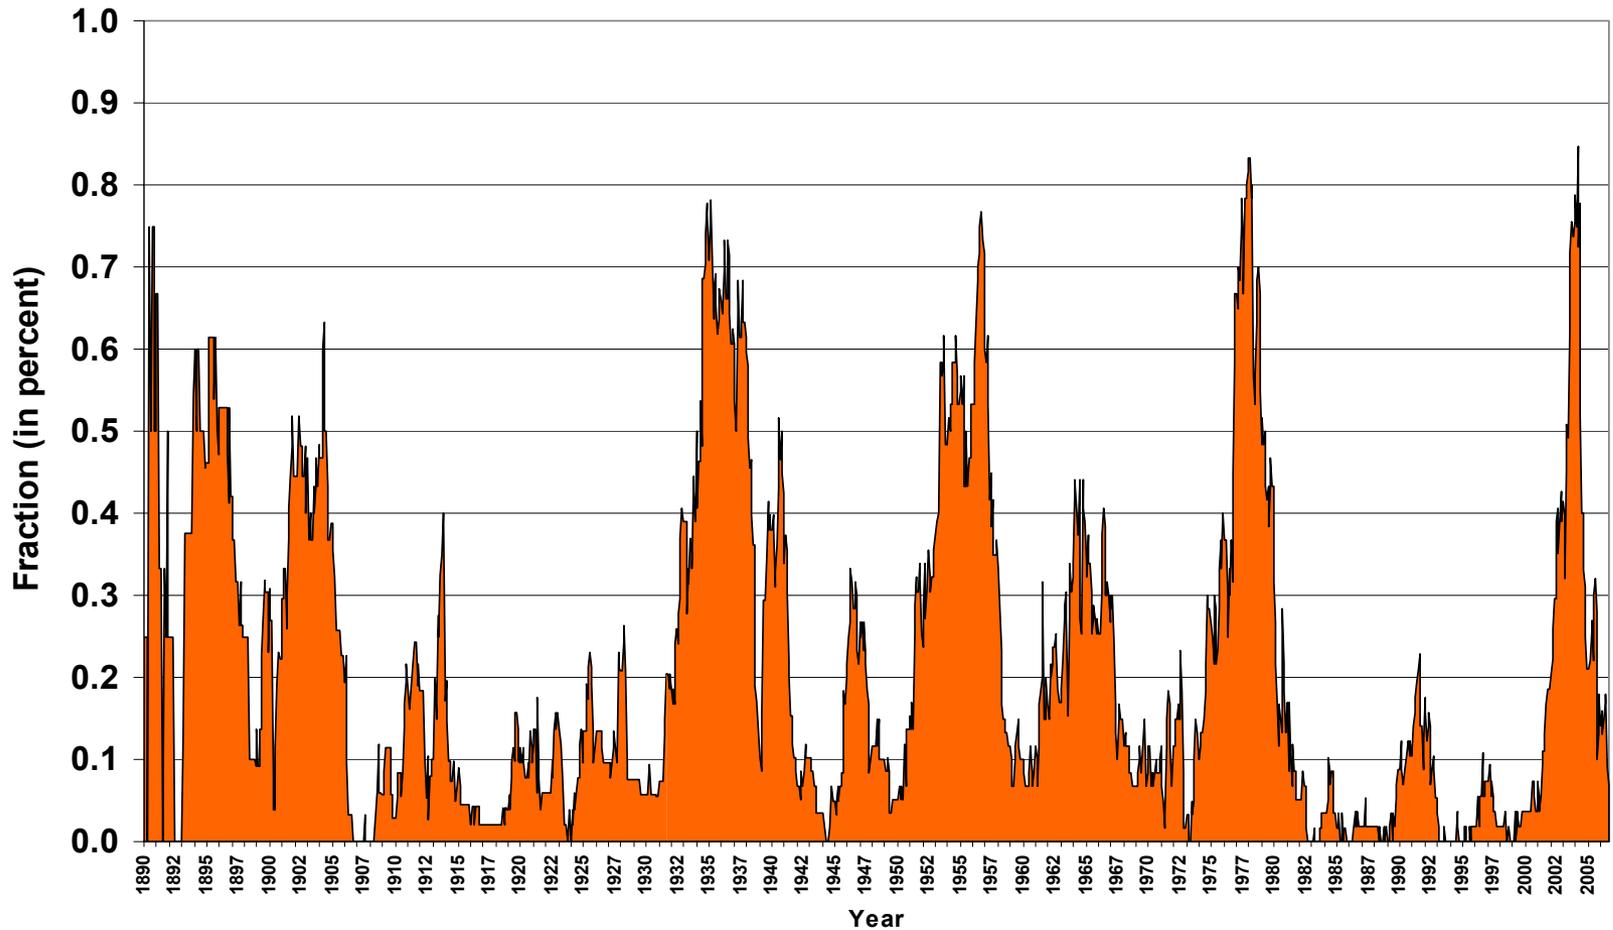

What should we do??

# Always plan for drought!
